

JIRA Story: E-commerce User Registration Feature

As part of the e-commerce platform, we are implementing a user registration feature to allow new users to create accounts, which will enable them to shop, save their information, and access their order history. This feature is crucial for enhancing user engagement and building a loyal customer base. Below is the detailed JIRA story for the user registration feature.

Story Details

Title: User Registration Feature for E-commerce Platform

Story ID: ECOM-101

Assignee: To Be Assigned

Priority: High

Sprint: Sprint 5

Description

As a new user,

I want to register on the e-commerce platform,

So that I can start shopping, save my information, and access my order history.

Acceptance Criteria

1. ****User Registration Form Requirements****:

- The registration form should contain fields for:
 - Username
 - Password
 - Email Address

- Phone Number (optional)
- The form should display a 'Register' button to submit and a 'Cancel' button to reset fields.
- Password should be at least 8 characters long and include a mix of letters and numbers.

2. **Form Validation**:

- All fields (except phone number) are mandatory.
- Username must be unique; duplicate usernames should trigger an error message.
- Email should be validated for proper format (e.g., name@example.com).
- Invalid email format should trigger a validation message.
- Password should follow minimum length and complexity requirements.

3. **Edge Cases**:

- Registration attempts with a username or email that already exists should display a relevant error message.
- Entering invalid formats for email or phone numbers should prompt an error message.
- Attempting registration with a weak password should display a 'Password Strength' indicator or message.

4. **Success and Failure Scenarios**:

- Upon successful registration, the user should see a success message and be redirected to the dashboard.
- If registration fails, the user should be informed with an error message and allowed to reattempt registration.

Additional Notes

- This feature should be responsive and function seamlessly on both mobile and desktop browsers.

- Accessibility requirements: all error messages should be screen-reader compatible.
- Implement client-side validations to enhance user experience, with server-side validation as backup.
- Ensure secure storage and handling of user credentials following best practices.
